Overview

Most solar water heaters require a well-insulated storage tank. Solar storage tanks have an additional outlet and inlet connected to and from the collector. Not only do these systems significantly reduce utility costs—by as much as 80%—but they also foster energy. In 2011, California adopted a Renewable Portfolio Standard (RPS) requiring that at least one-third of the state's electricity come from clean energy sources by 2020. It uses solar panels to absorb heat from the sun and transfer that heat to your hot water tanks. Our plumber recommended reducing the solar panels to 15 to make space for a large solar hot water system as that would be a more efficient design (while he charges about 10k for that). In one-tank systems, the back-up. But here's the kicker: photovoltaic panel auxiliary water tank installation could be the upgrade that makes your solar setup work smarter, not harder. Think of it like adding a turbocharger to your electric vehicle - same basic concept, but suddenly you're getting way more bang for your buc Let's.
