

# Electrochemical energy storage cycle

## Overview

---

This chapter describes the basic principles of electrochemical energy storage and discusses three important types of system: rechargeable batteries, fuel cells and flow batteries. A rechargeable battery consists of one or more electrochemical cells in series. This conversion process allows electricity generated at one time to be stored and used later, providing flexibility to modern power. The chapter starts with an introduction of the general characteristics and requirements of electrochemical storage: the open circuit voltage, which depends on the state of charge; the two ageing effects, calendaric ageing and cycle life; and the use of balancing systems to compensate for these. Energy storage and conversion technologies depending upon sustainable energy sources have gained much attention due to continuous increasing demand of energy for social and economic growth. Electrochemical energy storage (EES) technologies, especially secondary batteries and electrochemical. Electrochemical energy storage systems have the potential to make a major contribution to the implementation of sustainable energy.
