

# How to identify the gap in photovoltaic panels on drawings

## Overview

---

The gap between the last row of solar panels and the roof's edge should be a minimum of 12 inches or one foot. This ensures the panels are accommodated as they expand and contract during the day. These are precise, computer-aided design drawings (think AutoCAD or similar) that lay out everything for your PV system: panel placement, wiring routes, structural attachments, grounding/earthing, electrical flow, etc. projects, they must align with codes like the National Electrical Code. When working with solar installations, understanding CAD (Computer-Aided Design) drawings is crucial. Familiarize with technical specifications, 3. It provides a visual representation of how the panels will be arranged and. Provide an architectural drawing and riser diagram for the homeowner showing the planned location for future photovoltaic and solar hot water system components.
