

How to use smart microgrids

Overview

Use smart microgrids to power communities with locally produced renewable energy—increasing self-sufficiency and reducing emissions at the same time. A microgrid is a self-contained electrical network that allows you to generate your own electricity on-site and use it when you need it most. By integrating renewable energy sources like solar, wind, and battery storage with advanced monitoring and control systems, smart microgrids enable a more resilient, flexible, and environmentally-friendly. By taking the notion of an electrical island from a single home to multiple buildings or an entire community, communities, cities, and organizations are creating microgrids.
