

# India commercial microgrids

## Overview

---

Key drivers include the adoption of microgrids in rural electrification, and industrial sectors, and increasing demand for reliable, decentralized energy solutions. Microgrids in India are deployed to fill in for an unreliable utility grid, reach new off-grid customers, save money, and reduce carbon emissions. Indians who could afford it have long used diesel generators. The India microgrid market size was estimated at USD 2.38 billion in 2023 and is projected to grow at a CAGR of 19.3%, driven by the rising need for energy security, government initiatives promoting renewable energy, and advancements in battery storage technologies. Microgrids can connect and disconnect from the grid in short order and can operate in grid-connected mode or an independent island mode without being. A microgrid is a localized energy system that can generate, distribute, and regulate the flow of electricity independently or in coordination with the main power grid. It typically integrates various energy sources such as solar panels, wind turbines, batteries, and sometimes conventional.
