

Outdoor power supply maintains constant voltage

Overview

A constant voltage driver is designed to maintain a constant voltage level during operation regardless of current variations. For example, Sunpower's RS-25-5 can provide 5V/0~5A, the output voltage remains constant at 5V whilst the output current varies from 0~5A based on the load. While constant current powers modern LED lights, constant voltage still plays an important role in traditional lighting systems, especially those using halogen bulbs or LEDs with internal drivers. In this article, we. All LED lights require a power supply, but the LED's internal components will determine whether a constant current driver or a constant voltage power supply is needed. The power supply will attempt to deliver the set voltage, as long as the current drawn by the DUT does not exceed a predefined current limit.
