

# Promising energy storage batteries

*LiFePO<sub>4</sub> Battery, safety*

*Wide temperature: -20~55°C*

*Modular design, easy to expand*

*The heating function is optional*

*Intelligent BMS*

*Cycle Life: > 6000*

*Warranty: 10 years*

## Overview

---

Lithium-ion batteries are still the foundation of renewable energy storage solutions in 2025. Two chemistries lead the market: nickel manganese cobalt (NCM) and lithium iron phosphate (LFP). These technologies keep evolving to meet the just need for efficiency, affordable solutions. Lithium-ion batteries are currently the most widely used type, followed by alkaline and lead-acid batteries. However, each comes with notable drawbacks: lithium-ion batteries are prone to overheating and, in extreme cases, can explode; alkaline batteries are unsuitable for high-drain applications;. Breakthroughs in battery technology are transforming the global energy landscape, fueling the transition to clean energy and reshaping industries from transportation to utilities. Lithium-ion battery systems now cost just \$137 per kWh, down from \$1,200 per kWh in 2010 - a 90% price reduction in a decade. We have a long way to go, but we can build on.
