

Red alert for wind power generation

Overview

BEIJING (Reuters) - China has launched a risk alerting system to prevent further investments in wind power generation in certain locations, after large amounts of power were wasted due to inadequate power transmission infrastructure. Wind power or wind energy is a form of renewable energy that harnesses the power of the wind to generate electricity. It involves using wind turbines to convert the turning motion of blades, pushed by moving air (kinetic energy) into electrical energy (electricity). The National Energy Administration (NEA) has given a red alert. This page provides current information on Generation Resources, including forecast and actual generation for Wind and PhotoVoltaic (Solar) Generation Resources; Resource Outages; Reliability Unit Commitment (RUC) constraints; Reliability Must Run (RMR) Resource deployments; Fuel Type; and aggregate. For pilots flying over rural America, a string of red lights flashing along the horizon is a warning that there might be a wind farm ahead. But for many residents on the ground, the lights are an eyesore that has ruined their view of the night sky and disrupted the bucolic stillness that defined. WASHINGTON - The Department of the Interior announced today that it is pausing—effective immediately—the leases for all large-scale offshore wind projects under construction in the United States due to national security risks identified by the Department of War in recently completed classified.
