

Relationship between wind power and photovoltaic power generation

Overview

With a firm grasp of how wind is produced through solar energy, it becomes evident that these two forms of renewable power can coexist synergistically. Wind and solar projects can complement each other, particularly in regions where one resource may be less available. This study investigates the spatial and temporal dynamics of wind and solar energy generation across the continental United States, focusing on energy availability, reliability, variability, and cooperation. Using data from the National Renewable Energy Laboratory, we analyze the performance of. Solar photovoltaics (PV) and wind power have been growing at an accelerated pace, more than doubling in installed capacity and nearly doubling their share of global electricity generation from 2018 to 2023. For this reason, the present paper aimed to focus on photovoltaic and wind energy systems.
