

The principle of solar power generation in desk lamps

Overview

Solar desk lamps employ photovoltaic cells to convert sunlight into electricity. This conversion process occurs because these cells contain semiconductor materials, typically silicon, which have the unique property of generating an electrical current when exposed to sunlight. This process involves several key components, including solar panels, batteries, and LED lights. By understanding how these components work together, one can appreciate the efficiency and. This invention is a solar desk lamp, which consist of four aluminum plates, four solar plates, LED lamp, dimmer switch, battery charge indicative, charging battery, stand and weight. the solar plates are inside the cap and on the aluminum plates. Aluminum plates can rotate 90 degrees. At night, an electronic controller supplies this stored energy to a high-efficiency.
