

# The solar inverter waits for 60 seconds

## Overview

---

Restarting your SolarEdge inverter can often resolve Wi-Fi dropouts, communication faults, or minor system errors. Check that there are no visible faults, loose connections, or damaged isolators. The inverter has 60 changes per second to sync with the grid. If your inverter has a. Steps1: Confirm the DC Switch is turn on Step2: Measuring the voltage on the PV side with a multimeter, ensure the red probe is connected to the positive terminal and the black probe to the negative terminal. The correct measurement should be a positive number within the MPPT range. This is almost always the first step in any troubleshooting process, and may be all that's needed to resolve your issue.

## The solar inverter waits for 60 seconds
