

What is the name of the machine that provides inverter connection for communication base stations

Overview

The inverter is connected to the data collector through the RS485 communication line, and the data is uniformly transmitted to the server through the data collector. In communication base stations, since they usually rely on DC power, such as batteries or solar panels, while most communication equipment and other electronic equipment require AC power to operate properly, inverters are almost a necessity. Many solar inverters are equipped with wired communications such as RS485. Solar inverters connect to the grid through a process known as grid synchronization, which involves aligning the inverter's output voltage, frequency, and phase with the grid's parameters. Once synchronization is achieved, the inverter closes its output contactors, allowing bidirectional power flow. A typical communication base station combines a cabinet and a pole. FreeSpeak Edge Base Station is the foundation of a wireless intercom system with.
