

Will energy storage batteries be in excess in the future

Overview

In 2025, capacity growth from battery storage could set a record as we expect 18.3 GW of new battery. Lithium-ion batteries are the default chemistry used in EVs, personal devices, and even stationary storage systems on the grid today. But in a tough environment in some markets like the US, there's a growing interest in cheaper alternatives. Automakers right now largely care just about batteries'. Breakthroughs in battery technology are transforming the global energy landscape, fueling the transition to clean energy and reshaping industries from transportation to utilities. With demand for energy storage soaring, what's next for batteries—and how can businesses, policymakers, and investors. We expect 63 gigawatts (GW) of new utility-scale electric-generating capacity to be added to the U. power grid in 2025 in our latest Preliminary Monthly Electric Generator Inventory report. This amount represents an almost 30% increase from 2024 when 48. In 2025, battery technology is undergoing a major transformation — shaping the future of everything from electric vehicles to off-grid solar. Battery storage in the power sector was the fastest growing energy technology in 2023 that was commercially available, with deployment more than doubling year-on-year.
